

# PVPWare Software Installation Guide

Thank you for choosing PVPWare. This guide explains how to install the software on Windows systems when security warnings appear during download or installation.

## Why You See a Security Warning

Windows and web browsers may display warnings for applications that are not yet digitally signed or are not commonly downloaded. This is normal behavior and does not indicate that the software is unsafe.

## Step 1: Download the Installer

When downloading the installer using Google Chrome, you may see a message stating that the file is not commonly downloaded.

Click the three dots (■) next to the download and select **Keep**, then confirm **Keep anyway**.

## Step 2: Run the Installer

Double-click the installer file. If Windows displays a message saying "Windows protected your PC", click **More info** and then **Run anyway**.

## Step 3: Complete Installation

Follow the on-screen instructions to complete the installation. Once finished, you can safely launch PVPWare.

## Support

If you encounter any issues during installation, please contact PVPWare technical support.
